

Process Interlocking

### Key plans for padlocks

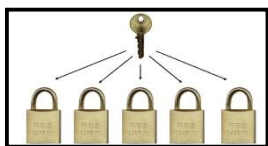

When implementing a padlock plan, client should decide which key plan is most convenient for their organization. Below the various possible options.

**Key to Differ**  
Every pad lock has its own unique key.

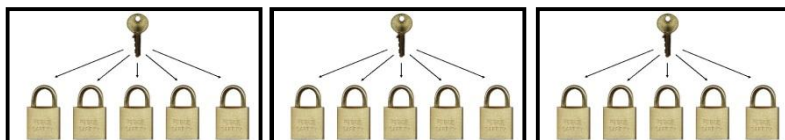

**Key to Differ + master key**  
Every pad lock has its own unique key which is overruled by a master key.

**Keyed alike**  
Pad locks can be opened with the same key. This is possible for the complete plant or per area.

**Keyed alike + master key**  
Certain groups are keyed alike. These groups are overruled with a masterkey.

### Key codes

Padlocks are sold everywhere, but often without guarantee for unique keys. Netherlocks keeps the codes per client or per site in a database, in order to guarantee duplicate keys in future extensions.

Key management results in higher safety level and provides flexibility maintaining your system.
